Using the app

The receptionist, live, with made-up customers: a **caller simulator** to ring it, and an **admin console** to see what it did.

Open it: https://pirtis-app.bravegrass-b863ec32.germanywestcentral.azurecontainerapps.io

The first visit after a quiet spell takes 40–50 seconds while the app wakes up. After that it answers at once.

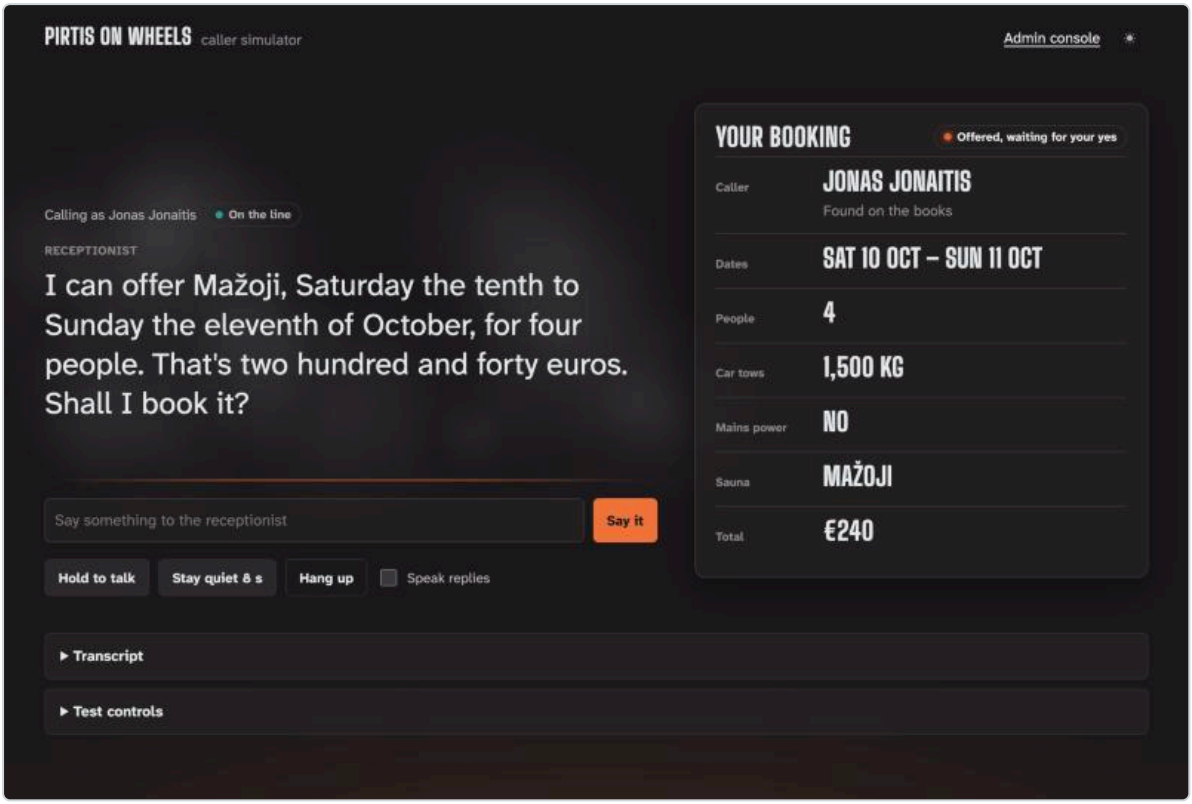

1. Sign in

1. Enter the **name** and **password** you were given. Accounts are made by hand. No account? Ask whoever sent you the link.
2. You land on the caller simulator, or on the page you opened the link for.
3. **Sign out** is at the top right (the admin console has it in the sidebar). A session lasts 12 hours.

After five wrong passwords, sign-in pauses for 15 minutes from your network.

2. Ring the receptionist

1. **Choose who's calling:**
   - a seed customer (Jonas, Tomas, Eglė or Rasa), who is on the books
   - or **Unknown number**, to be a new caller
2. **Speak or type.**
   - **Type:** write in the box and press *Say it*. This always works.
   - **Hold to talk:** works in Chrome, Edge and Safari, not Firefox. Your browser sends your voice to its own speech service, so type if you'd rather not.
   - **Replies are spoken aloud;** untick *Speak replies* to silence them.
3. **Watch the booking card.** Each detail comes out of the fog as the receptionist hears it:
   - the dates, the number of people, the car's towing limit, power and the sauna
   - hover over a detail to see the words it came from
   - after a booking, a text-message preview appears
4. **Rate any reply** with 👍 or 👎 and a note. The admin console's Feedback view collects them.
5. **Hang up** when you're done.

Things worth trying:

- a booking from start to finish: say who you are, then the dates, the number of people, and what your car can tow
- ten people (no sauna seats that many)
- a car that tows 700 kg
- "just book it" before anything was offered
- asking who has booked a sauna
- asking for a person

Test controls (the drawer under the call):

Control	What it does
How angry you sound	sets your next line's anger, 0 to 1
Cut in	your next line interrupts the receptionist's last one
Stay quiet 8 s	a silence: the receptionist checks in, then ends the call
Replay a fixture	runs one of the test cases through the real harness, with its verdicts

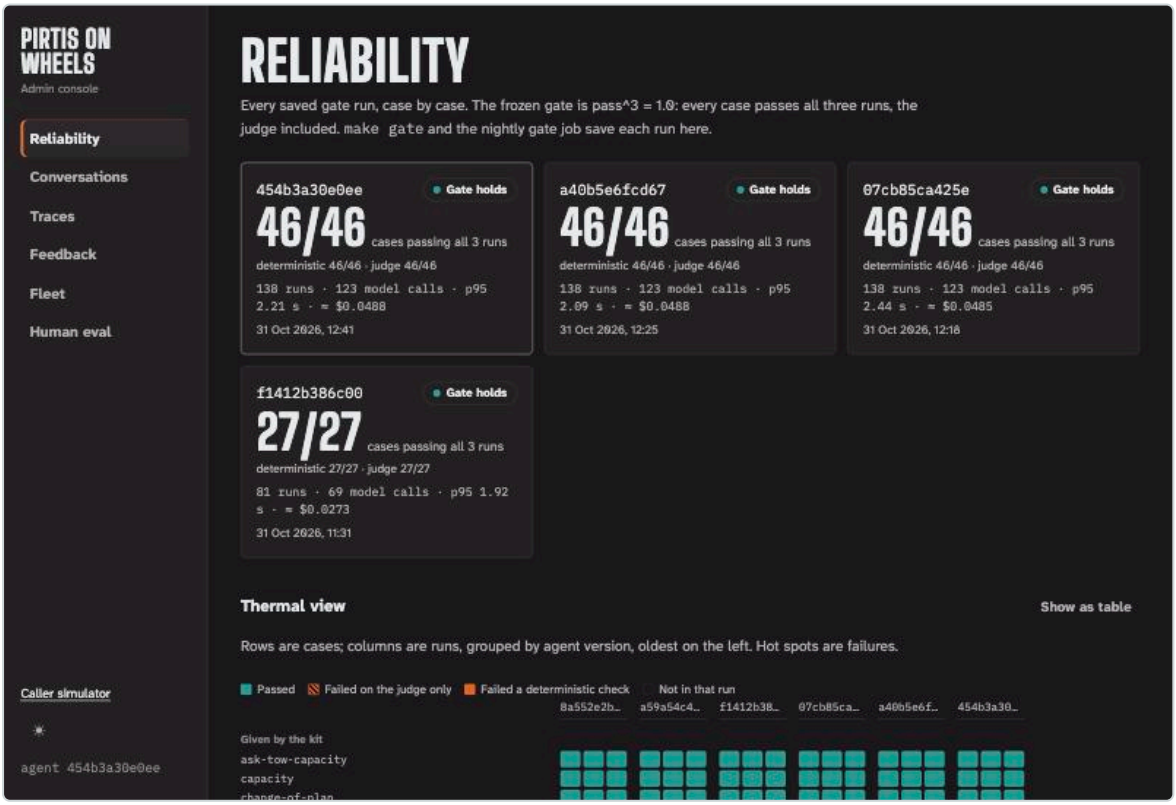

3. Test with a scenario card (the human evaluation)

1. Under *Test with a scenario card*, pick a card and press **Call with this card**. It gives you a customer, a goal, what you know and one twist.
2. Make the call. Stay in the role: use only the card's details, never your own.
3. When the call ends, press **Rate this call** and fill in the five questions:
    - was the goal reached?
    - did it sound natural?
    - were the numbers and dates clear?
    - did it ask one question at a time?
    - did it handle silences and interruptions?

    Add your initials and a note if anything stood out.
4. Do the next card.

The full protocol is in `tests/human/README.md`.

4. Look around the admin console

Open **Admin console** from the top bar.

View	What it shows
Reliability	every saved gate run, and the thermal view: rows are test cases, columns are runs; hot cells are failures (click one for its trace)
Conversations	from content-free turn records: the funnel from call to booking, intents, latency, tokens, API errors; *Playground* for calls, *Gate* for the nightly job
Traces	one turn at a time: what was said, what the model heard (with the quoted evidence), the decision, the API calls, the reply
Feedback	the 👍/👎 queue; *Save as test case* turns a rated reply into a fixture (in the cloud, the file downloads)
Fleet	every sauna's next 42 days, without saying who booked them; *what if* explains why a sauna fits or doesn't
Human eval	the scenario cards' ratings, and how far the automatic judge agrees with people

The theme switch (☀ / ☾) changes between the dark *Soot* and the light *Steam* themes.

Limits you may meet

- **"Too many requests this minute"**: wait a few seconds. Each account has its own per-minute allowance.
- **"Today's budget for model calls is used up"**: a shared daily cap, reset at midnight UTC.
- **Privacy:** calls are kept 30 days so they can be reviewed, then deleted. The customers are made up; please don't type your own details.

For the owner

Run these from `deploy/` (see `deploy/README.md`).

Add an account. Its password is written to `deploy/.passwords/<name>.txt`; hand it over privately, then delete the file:

```
make user NAME=ana
```

Remove an account; its sessions end at once:

```
make user-remove NAME=ana
```

Sign everyone out:

```
make rotate-session
```

Print the app's address:

```
make url
```
